ISSUE-TRACKER USERSTORIES AND SCENARIOIS

1. USERSTORIES
BIZ

This section contains the userstories from the business point of view.

1.1. Track issues from different projects

As an issues-manager
In order to manage issues from different projects
I wanto to be able to switch between different projects quickly

1.2. Track issues history

As an issues-manager
In order to keep track on what and when was planned
I wanto to be able to keep track on daily basis what was planned on a project daily, weekly, monthly and yearly issues.

1.3. Track issues progress

As an issues-manager
In order to keep track on what and when was accomplished vs. what was planned
I wanto to be able to keep track on daily basis what was planned and what whas accomplished on a project daily, weekly, monthly and yearly issues.

1.3.1. Measure success

As an issues-manager
In order to measure the success of the planned issues
I wanto to be able to measure the deliverables of each issue by comparable metrics.

1.3.2. Monitor success

As an issues-manager
In order to monitor the success of the planned issues
I wanto to be able to monitor the metrics of the issues.

1.4. Time management

As an issues-manager
In order to be prepare for issues such as (events , tasks) which have start and stop time
I wanto to be able to save their start_time and stop_time per issue in every possible interface

1.5. Track issues relations

As an issues-manager of a software related project
In order to trace the issues relations to userstories, features and tests
I wanto to be able to access the related objects to an issue by means of a link

1.5.1. Single entry point for end to end tests

As an ITOPS

In order to be able to verify all the features and functionalities of the tool within the System
I want to run a single shell call running all the end-to-end test of the application ensuring the prespecified features and functionalities.

1.5.2. Clarity and breavity of the end to end tests

As an ITOPS
In order to be able to verify all the features and functionalities of the tool within the System
I want to see the results of each test in 1 fow in the following format:.

1.5.3. Abort end-to-end tests on single test fail

As an ITOPS
In order to be able to run continuously end-to-end tests and skip for several runs failing teists
I want to be able to configure the single e2e entry point script to skip certain tests, but report me what was skipped.

1.6. control flow logging

As a CLI user
In order to be able to understand what the issue tracker tool is executing
I wanto to have configurable logging with stderr, stdout and file output

2. DEVOPS USERSTORIES

This section contains the userstories which could be accomplished by using the command line interface.

2.1. System performance

As an ITOPS
In order to ensure the performance of the System
I wanto the System containing the issue-tracker tool to perform its functions within the defined performance criteria

2.2. System stability

As an ITOPS
In order to minimize downtimes and ensure continuous operations
I wanto the System containing the issue-tracker tool to perform its defined functions on request without interruptions or unknown side effects

2.3. System reliability

As an ITOPS
In order to be able to rely on the operations of the tool
I wanto the System containing the issue-tracker tool to perform its functions as specified consistently

2.4. get a human readable description of the log of the specific run of the tool

As a CLI user
In order to be able to get a human readable description of the log of the specific run of the tool
I wanto to be able to translate the recorded uuid's in the execution run log to their respective records

2.5. components start run message print

As a CLI user

In order to know when a component has been started
I wanto to be able to see the "START <<COMPONENT_NAME>> on either the STDOUT or the log file of the
component

2.5.1. tool exit with exit code and exit message

As a CLI user or calling calling automated component
In order to be able to understand whether or not the execution of the call to the tool was successful or not
I wanto to get the exit code from the tool execution and see the exit message

2.5.2. execution path tracing by UUID's

As a DevOps operator
Foreach execution run of the tool
I want to be able to walk trough the execution path of the tool programatically.

2.6. Manage issues with a single txt file

As a CLI user
In order to be able quickly to view my issues
I wanto to be able to manage my daily,weekly,monthly and yearly issues by simply editing and viewing a
single txt file

2.6.1. Issues directories naming conventions

As a issues manager
In order to be able to manage lots of issues from different projects stored in plain txt files
I wanto to be able to store large quantity of issues txt files by their date on daily, weekly, monthly and yearly
basis

2.6.2. Issues files naming conventions

As a issues manager
In order to be able to manage lots of issues from different projects stored in plain txt files
and open them quickly
I wanto to be able to just type the first letter in a text editor supporting select opened file by typing its first letter
and jump to that file

2.6.3. Issues file open

As a CLI user
In order to be able quickly to access my issues (daily , weekly, monthly , yearly)
I wanto to be able to view my daily issues by simply opening a single txt file

2.6.4. Issues files history

As a CLI user
In order to be able quickly to search trough old issues
I wanto to be able to access old issues files by their date held in their file names from the file system

2.6.5. Issues files naming conventions

As a DevOps

In order to be able quickly to access and manage programatically issues

I wanto to be able to quess the file paths of the issues file by their date

2.6.5.1. Issues files naming conventions for the project

As a DevOps

In order to be able quickly to switch between different projects

I wanto to have the project name of the issues file in its name as the first token as follows:

<<issue_tracker_project>>-issues.<<current-iso-date>>.<<daily|weekly|monthly|yearly>>.txt

2.6.5.2. Issues files naming conventions for current date

As a DevOps

In order to be able quickly and programmatically to go back in the history

I wanto to have the current registration date in the file name and path

<<issue_tracker_project>>-issues.<<current-iso-date>>.<<daily|weekly|monthly|yearly>>.txt

2.6.5.3. Issues files naming conventions for the time frame

As a DevOps

In order to be able quickly and programmatically to go back in the history

I wanto to have the current registration date in the file name and path

<<issue_tracker_project>>-issues.<<current-iso-date>>.<< (daily|weekly|monthly|yearly) >>.txt

2.7. Issues transformations

As an cli user of the System

In order to be able to sort the issues according to their attributes

and edit them in both txt file and xls filee

I wanto to be able to perform the following loads:

txt-to-db - to load a txt file with issues to an issues table in db

db-to-xls - to load a xls file from db table to xls

xls-to-db - to load a xls file with issues to an issues taable in db

db-to-txt - to load a txt file from db table

2.7.1. txt-to-db action load

As an cli user of the System

in order to store my issues in structured form to db for further processing

I want to be able to load any issue file with a single line shell call to a db

2.7.1.1. Load issues file from file system to db

As an cli user of the System

- in order to be able to handle issues from different projects

- and load them to db for further processing

I want to:

- pre-set the variables of the project

- and than load any issue file with a single line shell call to a db

- and optionally specify the period of the issues file (daily , weekly , monthly , yearly) with daily as default

2.7.2. db-to-xls action load

As an cli user of the System

in order to be able to sort and edit my issues in Excel

I want to be able to unload my issues from the issue relational table from db

2.7.3. xls-to-db action

load

As an cli user of the System

in order to store my issues in structured form to db for further processing after being sorted in Excel

I want to be able to load my latest xls file with a single line shell call to a db

2.7.4. db-to-txt action

load

As an cli user of the System

in order to store my isssues in more structurized data format for further procesing

I want to :

- be able to load the issues for a period from the db to a file

- and optionally specify the period of the issues file (daily , weekly , monthly , yearly) with daily as default

2.7.4.1. xls-to-db action load sort by issues prio attribute

As an cli user of the System

during the db-to-txt action load

in order to understand the priority of my issues

I want to :

- be able to specify the order in the issues txt files lines to be based on the prio attribute

2.7.4.2. db-to-txt action load sort by issues start_time

attribute

As an cli user of the System

during the db-to-txt action load

in order to understand the priority of my issues

I want to :

- be able to specify the order in the issues txt files lines to be based on the start_time attribute (start_time could be in the following format YYYY-mm-dd HH:MM in start_time or HH:MM)

2.7.4.3. db-to-txt action load sort by issues start_time

attribute

As an cli user of the System

during the db-to-txt action load

in order to view the issues by categories

I want to :

- be able to specify the order in the issues txt files lines to be based on the category attribute

2.7.5. Load issues file from db to file

system

As an cli user of the System

in order to store my isssues in more structurized data format for further procesing

I want to :

- be able to load the issues for a period from the db to a file

- and optionally specify the period of the issues file (daily , weekly , monthly , yearly) with daily as default

2.8. issues file filtering

As a CLI user

In order to filter quickly my issues

I wanto to be able to show the issues with their categories of only certain status

2.9. Single shell call for projects switching

As an issues-manager

In order to be able to switch between different projects quickly

I wanto to be able to issue a single shell call for loading a project's configuration

and run the issue-handler against this pre-loaded configurtion

2.10. system testability

As a Developer

In order to ensure the stability and expandability of the application

I want to be able to run for each implemented userstory a single test

2.10.1. UUID tracability for test files and userstories

As a Developer

In order to identify each userstory to be tested with its according test

I want to be able to track each userstory or test code entry point file by UUID.

3. UI USERSTORIES

This section contains the userstories which could be accomplished by using an Graphical User Interface.

3.1. Time management

As an issues-manager

In order to be prepare for issues such as (events , tasks) which have start and stop time

I wanto to be able to view the issues with the same title, start_time and stop_time in google calendar

3.2. Issues listing

As an UI user of the system I want to be able to list the issues stored in it.

3.2.1. Issues sorting in list view

As an UI user of the system I want to be able to sort the issues by :

- issue name
- issue priority
- issue start-time
- issue create-time
- issue update-time

3.2.2. issues re-ordering

As a UI user

In order to prioritize my issues

I wanto to be able to drag and drop issues in the UI

3.2.2.1. issues re-ordering by category

As a UI user

In order to prioritize my issues

I wanto to be able to drag and drop issues in the UI by category

3.2.2.2. issues re-ordering by single issue

As a UI user
In order to prioritize my issues
I wanto to be able to drag and drop issues in the UI by single issue
